

Duane! (and other stuff)

Data Centers Going Green

The average data center runs at about **15% efficiency**, so you can guess there are a few dormant servers sitting around, the DOE's **Paul Scheihing** told the NVTC Green Tech Committee **yesterday** at the Tysons' offices of Ernst & Young. Paul says the DOE is creating a toolbox to help companies improve energy efficiency in their own data centers. The goal is to have **1,500 volunteering companies** make their data centers 25% more efficient (with 200 of those companies becoming 50% more efficient) in the next decade.
